## Abstract

**Background:** Breast cancer (BC), as a significant global health problem, is the most common cancer in women. Despite the importance of clinical cancer registries in improving the quality of cancer care and cancer research, there are few reports on them from low- and middle-income countries. We established a multicenter clinical breast cancer registry in Iran (CBCR-IR) to collect data on BC cases, the pattern of care, and the quality-of-care indicators in different hospitals across the country.

**Methods:** We established a clinical cancer registry in 12 provinces of Iran. We defined the organizational structure, developed minimal data sets and data dictionaries, verified data sources and registration processes, and developed the necessary registry software. During this registry, we studied the clinical characteristics and outcomes of patients with cancer who were admitted from 2014 onwards.

**Results:** We registered 13 086 BC cases (7874 eligible cases) between 1.1.2014 and 1.1.2022. Core needle biopsy from the tumor (61.25%) and diagnostic mammography (68.78%) were the two most commonly used diagnostic methods. Stage distribution was 2.03% carcinoma in situ, 12% stage I, 44.65% stage II, 21.32% stage III, and 4.61% stage IV; stage information was missing in 1532 patients (19.46%). Surgery (95.01%) and chemotherapy (79.65%) were the most common treatments for all patients.

**Conclusion:** The information provided by this registry can be used to evaluate and improve the quality of care for BC patients. It will be scaled up to the national level as an important resource for measuring quality of care and conducting clinical cancer research in Iran.

Keywords: Breast cancer, Health policy, Hospital, Quality indicator, Registry

# Introduction

Breast cancer (BC), as a significant global health issue, is the most diagnosed cancer in women with an estimated 2.3 million new cases annually, representing 25% of all cancer diagnoses among women.<sup>1</sup> BC is one of the most diagnosed cancers in the low-, and middle-income countries, including Iran.<sup>2-5</sup> Since the incidence and mortality rates of BC are increasing, almost all countries are facing an economic burden due to BC.<sup>2,6,7</sup> However, the lifetime risk of developing BC differs by country and ethnicity due to exposure to different risk factors. Various factors determine the incidence and mortality rates of BC in different countries, including economic development, environmental factors, and ethnicity.<sup>6</sup> When comparing data from developed and developing countries, differences are observed in BC incidence and mortality rates. Comparatively, developed countries display high incidence and low mortality rates of BC, whereas developing countries display low incidence and high mortality rates. The disease is most reported in Western Europe and the United States, while it is least reported in Africa and Asia, which may reflect a false prevalence.

BC prevention, lack of awareness and screening protocols, lack of or limited access to diagnostic centers in rural areas for early detection, lower standards of healthcare facilities, and improper management of diagnosed cases could have significant impact on treating this disease.<sup>7-10</sup> Hence, the efforts of the World Health Organization (WHO) are focused on three main pillars within the Global Breast Cancer Initiative (GBCI), namely: 1) health promotion and early detection, 2) reduced delay to health system access, and 3) comprehensive BC management, particularly where cancer programs are often inaccessible and under resourced.11 For the sake of the three main GBCI programs, registries can serve as an integral part for monitoring the programs and providing evidence for informed decision makings.<sup>12,13</sup> Furthermore, registries can affect other approaches, such as convening

stakeholders and developing a platform for action and operational guidance.<sup>12</sup> In this regard, hospital-based cancer registries have collected different data elements about BC patient management, such as diagnosis, treatment, follow-up, and quality indicators.<sup>14,15</sup>

Similar to most other countries, BC is the most common cancer in Iran and annually more than 17 000 new BC cases are diagnosed.<sup>1</sup> It is expected that the incidence rate of BC will be doubled in a decade.<sup>9</sup> Therefore, early detection and proper management of BC is a growing public health issue. We established a multicenter clinical breast cancer registry in Iran (CBCR-IR) to collect data about BC cases, the pattern of care, and the quality-of-care indicators in different hospitals across the country. The results of this registry provide evidence for health policy making and for interventions to improve diagnostic and therapeutic procedures in hospitals, at local and national levels. In this paper, we aimed to introduce the CBCR-IR, its study protocol, and its early descriptive results during the first five years of the registry implementation.

# Objectives

The main objective of this registry was to collect the hospital-based data and to evaluate the quality of BC care in Iran and compare the quality-of-care indicators in different settings in Iran. The specific objectives of the registry are:

- To evaluate the patterns of care and benchmark the patient outcomes in different regions,
- To evaluate the effectiveness of diagnosis and treatment rates over time,
- To improve the quality of BC care,
- To develop a database for clinical and epidemiological research,
- To develop a basis for professional education.

# Materials/Patients and Methods

History of the CBCR-IR Registry Design

For the first time in 2012, international experts

recommended establishing clinical/hospital-based cancer registries in Iran.<sup>16</sup> The clinical cancer registry was established in 2014 in the Cancer Institute of Iran in the form of a hospital cancer registry that prioritized data on four common cancer sites in Iran, including breast, esophagus, stomach, and colorectal cancers. The details about the implementation steps and the results of the pilot phase have been published elsewhere.<sup>17</sup> In 2018, following the successful experience of hospital cancer registry in the Cancer Institute of Iran, we designed and established a national collaboration network of oncology centers and hospitals across the country to join the registry (a multicenter CBCR-IR). Currently, we are collaborating with 10 provinces (including 16 hospitals) (Figure 1).

# Establishment of the Minimum Dataset and the Software

During the pilot phase, a primary minimum dataset was developed using different international sources such as the International Classification of Diseases, 3rd edition (ICD-O-3),<sup>18</sup> the 2016 Revision of Facility Oncology Registry Data Standards (FORDS),<sup>19</sup> and the review of the international literature. The minimum dataset was further adjusted by a panel of experts including oncologists, surgeons, and epidemiologists. After the pilot

phase of using the minimum dataset, it was updated and included some risk factors related to patient outcomes, comorbidities, and biopsy information. We also included both clinical and pathological staging of BC patients. The registry currently collects about 200 variables in different domains (Box 1). We adapted a web-based and opensource software called the District Health Information Software (DHIS2) for online data collection.<sup>20</sup>

# Structure and Organization

So far, 16 hospitals from 12 provinces across the country have been collaborating in the CBCR-IR network (Figure 1). The Cancer Institute of Iran is hosting and coordinating the registry network. In each collaborating center, a co-principal investigator (Co-PI) supervises a registry team to collect and monitor the quality of data of the registry in collaboration with the Cancer Institute (Figure 2). The recruitment of new centers is an ongoing process, and the number of centers is increasing. The processes for recruitment include evaluation of the readiness of a center, performing a pilot study and signing a collaboration agreement with the registry, and participation in a training session. Representatives from the participating centers are the members of the steering

Figure 1. Centers Involved and Structure of Clinical Breast Cancer Registry of IR. Iran (CBCR-IR)

**Box 1.** The minimum dataset of the Clinical Breast Cancer Registry of IR. Iran (CBCR-IR)

#### **Identifying information**

Hospital name Demographics (gender, nationality, etc.) Contact details

## **Risk factors**

Smoking, alcohol, opium, and hookah use Menopause status and pregnancy at the time of diagnosis History of breast cancer or other cancers History of radiation on chest or neck History of breast or ovarian cancer among the first- and seconddegree relatives

# Comorbidity

Cardiovascular diseases Kidney and liver diseases Chronic lung diseases Cancers Diabetes and overweigh Brain and neurologic diseases

#### Biopsy and imaging information

Fine-needle aspiration (FNA), Core needle biopsy (CNB) Mammography, sonography (breast, abdominal and pelvic), MRI (breast, brain), CT scan (chest wall, abdominal, and pelvic)

# Staging (clinical - pathologic) and prognostic factors

Cancer identification Tumor information Lymph node information (\*

#### Immunohistochemical factors

Estrogen Receptor (ER), Progesterone Receptor (PR), Human epidermal growth factor receptor 2 (HER2), Ki67, P53

# Treatment

Surgery Chemotherapy (neoadjuvant and adjuvant) Radiotherapy (neoadjuvant and adjuvant) Hormonotherapy Targeted therapy

#### Follow-up

Vital status Cause of death Presence of local recurrence or distant metastasis

## Type of record dates

Date of birth Date of diagnosis Date of biopsy sampling and imaging processes Date of treatments Date of last contact Date of death Date of local recurrence or distant metastasis

committee of CBCR-IR which act as the governing body for the registry.

# Selection of Hospitals or Centers/Provinces

The process of province selection includes five steps, namely: 1) sending a call for collaborating centers; 2) completing application and feasibility forms by the volunteering centers; 3) implementation of pilot phases in volunteer centers; 4) reviewing the results obtained by the Cancer Institute of Iran, selecting eligible centers; 5) signing an agreement between the main center and collaborating centers.

Each collaborating center establishes its organizational structure similar to the structure of the main center except on a smaller scale.

# **Education and Training**

Two types of training courses were held, including inperson workshops at the beginning of activities in each center and periodic online workshop. In addition, a forum supports the registrars across the country and provides answers and explanations for the problems faced during the routine work.

# **Data Collection Process**

The primary product of the cancer registry is reliable data on cancer cases. Various programs and major decisions are based on these data. Therefore, selecting the most appropriate method for data collection and determining the structure for quality control of data is critical for a cancer registry. It is imperative to note that a clinical cancer registry is structured by collecting data from different hospitals and health centers with an expansive range of differences in geographical location, access to diagnostic equipment, specialist resources, and financial constraints. As part of our clinical cancer registry, 12 provinces and 16 hospitals and health centers were included. These centers varied in terms of the number of patients treated as well as other parameters. Thus, the design and implementation of the project required a variety of management programs and flexibility to coordinate different departments.

The essential source of BC registry data items is medical reports (both inpatient and outpatient). Other sources for data collection were also used, including hospital information systems, and pathology and imaging reports. The centers contact patients and collect materials and information from patients or their next of kin. We also collect documents and follow-up information from the National Organization for Civil Registration, and actively through telephone interviews with patients or their caregivers.

# Inclusion and Exclusion Criteria

We set the commencing date of the registry on January 1, 2014, and BC patients' data was registered if their diagnosis was made after this date. The starting date of the registry for collaborating centers varied across different centers based on availability of the data. Each center recruited its patients if they had a diagnosis of BC and received one of their initial treatment procedures in that specific hospital. BC morphologies other than adenocarcinoma such as melanomas, sarcomas, and lymphomas were excluded from the CBCR-IR.

# Limitation and Implementation Challenges

Our cancer registries had several limitations in terms of

Figure 2. Flowchart of Patient Identification and Data Collection for the Clinical Breast Cancer Registry of IR. Iran (CBCR-IR)

data collection and accuracy that needed to be addressed. These included 1) lack of access to old patient records, particularly those from the past few years, 2) lack of a specific and regulated structure for collecting diagnostic and therapeutic data on patients referred to medical centers by medical staff, 3) absence of electronic record systems, 4) illegibility of patients' paper-based history records, 5) lack of access to patients for follow-up due to incorrect contact information, death or change in residence or unwillingness to cooperate because of dissatisfaction with the medical services provided, 6) lack of sufficient registrar training, 7) the need to update the registration guide and to hold continuous training sessions on how to access the right resources and gather quality information (Table 1).

# **Quality Control Process**

In terms of completeness and validity, our quality control

Table 1. Data Source Used by Different Centers for Collection of Patient Data in the Clinical Breast Cancer Registry of IR. Iran (CBCR-IR)

Center Name	Medical Report	Telephone Contact	In-person Interview	Link with Other Centers or Provinces for Data Collection
Tehran (Cancer Institute of Iran)	Yes	Yes		
Urmia (Imam Khomeini Hospital)	Yes			
Bushehr (The Persian Gulf Martyrs Hospital)	Yes	Yes		Yes
Arak (Ayatollah Khansari Hospital)	Yes			
Kermanshah (Imam Reza Hospital)	Yes			
Rasht (Poursina Hospital)	Yes	Yes		
Mazandaran (Babol) (Ayatollah Rohani Hospital)	Yes			
Isfahan (Omid& Alzahra Hospital)	Yes	Yes		
Ilam (Mostafa Khomeini Hospital)	Yes			
Sabzevar (Vaseei Hospital)	Yes			
Lorestan (Shahid Rahimi Hospital)	Yes	Yes	Yes	
Sistan and Baluchestan (Zahedan) (Ali Ibn Ali Taleb & Khatam al-Anbia Hospitals)	Yes	Yes		

team (including an oncologist expert and epidemiologist at the cancer institute) uses several methods to validate our registry data through: 1) reviewing 10 percent of randomly selected data from each year's registered cases by trained registrars and providing feedback to the principal investigators (PIs) and registrars in each study site and 2) cross-validating with other sources of data, e.g. by contacting patients or their caregivers and/or using data from other databases (e.g. causes of death registry, operation lists, etc) in order to complete the missing information and continuously monitor data validity. Centers are allowed, if necessary, to interview patients face-to-face and collect missing data items.

# Ethical Considerations and Privacy Issues with Secondary use of Data

We obtained ethics approval from Tehran University of Medical Sciences (TUMS) (Ethical Code: IR.TUMS.VCR. REC.1398.1015). Access to the data processing software is role-based and limited to people who are introduced by the manager of each center. Registrars and managers access the registry system using safe passwords.

The CBCR-IR's online web-tool has various rolebased access levels managed by the director at the Cancer Institute of Iran; for example, registrars can only import and edit data but cannot delete or export data. Moreover, each supervisor in different centers can export their own data and cannot access other centers' data.

Furthermore, registrars and all team members have been trained to preserve the confidentiality of patient data and consider the ethical principles of this registry. In addition, we have developed a data sharing guideline and defined the roles and responsibilities for the registry teams and investigators requesting the data. Data are anonymized before sharing with researchers. All patient information is periodically backed up by the main center and the software server is protected by the Tehran University of Medical Science.

# Results

From a total of 13086 cases who were admitted to our network's hospitals between January 1, 2014 to January 1, 2022, 7874 eligible BC patients were included in our analysis. The patients' mean age at the time of diagnosis was  $49 \pm 13.60$  years. Only 271 (3.44%) cases had a screening mammography (Table 2). The diagnostic methods were core needle biopsy from the tumor (61.25%) and diagnostic mammography (68.78%).

Stage distribution was 2.03% carcinoma in situ, 12% stage I, 44.65% stage II, 21.32% stage III, and 4.61% stage IV; stage information was missing in 1532 patients (19.46%) (Table 3). On the basis of immunohistochemical information, 4409 (55.99%) of patients were estrogen receptors/ progesterone receptor (ER/PR) positive and 1725 (21.91%) were human epidermal growth factor receptor (HER2) positive. However, the ER/PR and HER2 status were missing in 24.55% and 25.22%, respectively (Table 3).

Surgery (95.01%) and chemotherapy (79.65%) were the most common treatments for all patients (Figure 3). Only about 17% of patients underwent neoadjuvant chemotherapy. We also found that 66.43% of patients received adjuvant radiotherapy. The proportion of hormone therapy and targeted therapy in our study population was 52.88% and 20.81%, respectively.

# Discussion

This program provides a valuable database about BC patient care from different geographical areas in Iran. It includes more than 200 variables and collects high quality data about demographics, risk factors, diagnosis, treatments, and follow-ups. This registry has registered more than 8000 BC patients across the country and provides an opportunity to conduct several studies about BC care and to determine the status of the care indicators of BC care in Iran overall and by hospitals located in different parts of the country. The registry makes it possible to compare hospitals and monitor the

Numbering centres according to the place in the map (Figure 1). \* Information was collected using medical reports and telephone or in-person interview with patients \*\* Information was collected using telephone interviews with patients without access to medical reports \*\*\* Information was collected using medical reports improvement after interventions in the patient care in each participating center and the country overall. As a result, policy makers will receive ongoing feedback that will help reduce inequalities across hospitals, improve tailored treatments, and increase compliance with national guidelines. Clinical performance and outcomes can be measured and tracked using quality indicators (QIs), which are standardized, evidence-based measures of quality of care.

Clinical breast cancer registry of Iran

and tracked using quality indicators (QIs), which are standardized, evidence-based measures of quality of care. A list of 33 benchmark QIs was proposed by the European Society of Breast Cancer Specialists (EUSOMA) in 2010 and updated in 2017 to allow standardized auditing and quality assurance of care.<sup>21</sup> Clinical cancer registries as a source of information about steps of diagnosis and treatment can help to determine and publish QIs that are being used in a variety of medical studies, and they provide an ideal infrastructure for estimating QIs regularly and comparing IQs across hospitals that may facilitate changes in guidelines.<sup>22</sup> For example, studies published recently have shown that women undergoing breast conserving therapy have a better survival rate than those undergoing mastectomy.<sup>21-27</sup> Quality care assessment is common in developed nations but is very rare in developing countries. Recently, a study in Morocco reported the result of breast QIs in that country.<sup>28</sup> Our registry provides access to large datasets from several hospitals, which can be used to evaluate the quality-of-care levels across Iran.

In addition to evaluating standards and guideline adherence, it is crucial to determine limitations and correct weaknesses in the diagnosis and treatment processes. One of the most critical sections relates to improving the infrastructure and access to essential cancer care services, which is expected to improve patient outcomes and reduce cancer incidence. A study showed that Eastern Mediterranean Regional (EMRO) countries, such as Iran, encounter varying conditions in terms of access to diagnostic equipment, such as computerized tomography (CT) scanners, magnetic resonance imagines (MRIs), and positron emission tomography (PET) scanners.<sup>29</sup> In the EMRO region, our CBCR is the largest database, which can answer a wide range of questions regarding quality of care and access to health services. Also, governments with a focus on CBCR data can determine policy makers rules and monitor programs that would affect the GBCI.<sup>12,13</sup> By analyzing the available data, we will be able to evaluate key strategies to achieve the objectives of GBCI, including health promotion and early detection, timely diagnosis, and comprehensive BC management.<sup>12,13</sup>

We encountered a number of challenges in our study. Since hospitals and facilities in different provinces have different management systems (Table 1), the primary registry protocol needed to be changed to accommodate the differences. There is missing data in some sections due to these variations across centers. For example, the completeness of staging data was 80.54% for BC in our study, which compares weakly with 94% of the Australian national average or 90% of Canada in 2010 for female

Seyyedsalehi et al

# 120

BC.<sup>30,31</sup> In order to overcome challenges, we had to employ a variety of management strategies, including inperson interviews, integrating data from other sources, and conducting telephone follow-ups.

In conclusion, the information provided by this registry can be used to evaluate and improve the quality of care for BC patients. It will be scaled up to the national level as an important resource for measuring quality of care and conducting clinical cancer research in Iran.

## Acknowledgments

Special thanks are due to Cancer Research Centre, Cancer Institute (Tehran University of Medical Sciences), Clinical Research Development Center, The Persian Gulf Martyrs (Bushehr University of Medical Science), Imam Khomeini Hospital (Urmia University of Medical Sciences), Ayatollah Khansari Hospital (Arak University of Medical Sciences), Imam Reza Hospital (Kermanshah University of Medical Sciences), Poursina Hospital (Gilan University of Medical Sciences), Poursina Hospital (Gilan University of Medical Sciences), Omid and Alzahra Hospital (Isfahan University of Medical Sciences), Mostafa Khomeini Hospital (Ilam University of Medical Sciences), Vaseei Hospital (Sabzevar University of Medical Sciences), Shahid Rahimi Hospital (Lorestan University of Medical Sciences), Ali Ibn Ali Taleb and Khatam al-Anbia Hospitals (Zahedan University of Medical Sciences) and other members of the cancer registry for their guidance and support.

#### Authors' Contribution

**Conceptualization:** Monireh Sadat Seyyedsalehi, Kazem Zendehdel, and Azin Nahvijou.

Data curation: Monireh Sadat Seyyedsalehi.

Formal analysis: Monireh Sadat Seyyedsalehi, Kazem Zendehdel. Funding acquisition: Shaghayegh Haghjooy Javanmard, Habibollah Pirnejad, Zahra Niazkhani, Arash Golpazir Sorkheh, Jamshid Anasari, Maryam Marzban, Atefeh Esfandiari, Novin Nikbakhsh, Yahya Baharvand Iran Nia, Mohammad Taghi Ashoobi, Alireza Ansari-Moghaddam, Maryam Moradi Binabaj, Hassan Nourmohammadi, Kazem Zendehdel.

Investigation: Monireh Sadat Seyyedsalehi, Amirreza

Manteghinejad, Maryam Baniamer, Masoud Bahrami, Seyedeh Masoumeh Ghoreishi, Shahram Ahmadi Somaghian, Fataneh Bakhshi, Mahdieh Bakhshi.

**Methodology:** Monireh Sadat Seyyedsalehi, Kazem Zendehdel, Azin Nahvijou, Ramesh Omranipour, Mojtaba Vand Rajabpour

**Project administration:** Amirreza Manteghinejad, Maryam Baniamer, Masoud Bahrami, Seyedeh Masoumeh Ghoreishi, Shahram Ahmadi Somaghian, Fataneh Bakhshi, Mahdieh Bakhshi. **Software:** Monireh Sadat Seyyedsalehi.

**Supervision:** Monireh Sadat Seyyedsalehi, Shaghayegh Haghjooy Javanmard, Habibollah Pirnejad, Zahra Niazkhani, Arash Golpazir Sorkheh, Jamshid Anasari, Maryam Marzban, Atefeh Esfandiari, Novin Nikbakhsh, Yahya Baharvand Iran Nia, Mohammad Taghi Ashoobi, Alireza Ansari-Moghaddam, Maryam Moradi Binabaj, Hassan Nourmohammadi, Kazem Zendehdel.

**Resources:** Kazem Zendehdel.

Validation: Mojtaba Vand Rajabpour.

Visualization: Monireh Sadat Seyyedsalehi, Kazem Zendehdel.

Writing-original draft: Monireh Sadat Seyyedsalehi, Kazem Zendehdel.

#### **Competing Interests**

Authors declare that they have no conflict of interest.

# **Consent for Publication**

Not applicable.

## **Data Availability Statement**

The data supporting this study findings are available from the corresponding author upon reasonable request.

#### **Ethical Approval**

This article has ethical approval with approval ID: IR.TUMS.VCR. REC.1398.1015 and IR.TUMS.VCR.REC.1400.231 evaluated by the vice-chancellor in research affairs, Tehran University of medical sciences.

## Funding

We would also like to show our gratitude to the national clinical breast cancer registry and colleague's provinces (Tehran, Urmia, Bushehr, Arak, Kermanshah, Rasht, Mazandaran, Isfahan, Lorestan, Sistan and Baluchestan) with grants number 99-01-115-46513 and 1400-01-115-52576 for sharing their clinical breast cancer data with us during the course of this research.
